UNITED STATES PATENT OFFICE

JULIUS J. STEINHART, OF SHAMOKIN, PENNSYLVANIA

AMUSEMENT DEVICE FOR BATHING POOLS

Application filed November 17, 1927. Serial No. 233,884.

The invention relates to an amusement device for bathing beaches, pools, and the like, and has for its object the provision of a plurality of standards erected in the water and having grooved pulleys mounted thereon on which is trained an endless cable or other flexible element to which is secured spaced lead lines to be attached to boats or other floating objects or that may be grasped by bathers, said flexible member being actuated by a suitable motor located on the land or any other convenient location and geared to the cable to maintain it in operation.

The invention will be described in detail hereinafter and will be found illustrated in the accompanying drawings in which

Figure 1 is a top plan view of the amusement device, and

Figure 2 is a side elevation of the mechanism for operating the device.

Referring to the drawings in which similar reference characters will be used to indicate corresponding parts in both views, the improved amusement device comprises a plurality of standards 1 that are erected on the bottom of the pool or other bathing resort, the number of standards 1 selected for illustration being three, but it will be apparent that any number of standards may be employed depending upon the size of the pool and the number of bathers or amusement seekers to be accommodated. Each of the standards 1 is provided at its upper end with a reduced circular bearing 2, the bearing to carry the driving means, to be hereinafter described being designated 2^a, and of sufficient length to journal the sleeves 3 forming a hub for two grooved pulleys designated 4 and 5, respectively, 6 indicating grooved pulleys journaled on the bearings 2 on the other standards 1. Each of the pulleys 4, 5, and 6 have their lower edges extended beyond the groove in the periphery of the pulley to form a flange 7 to obviate to some extent the flexible members to be hereinafter described

dropping off of the pulleys because of stretching of the flexible members in use. 8 indicates a cable or other flexible member trained on the pulleys 4 and 6 and having a plurality of lead lines 9 connected thereto and adapted to be engaged with boats or other floating objects (not shown) or to be grasped by bathers when the device is in operation.

The device may be operated by any suitable means, a motor 10 being selected for the purpose of illustration and may be erected on the shore or on a pier built out into the water, as may be found most convenient and is connected to the pulley 5 by train of gearing suggested at 11, 12 indicating an idler for one of the flights of the belt or cable 13 trained on the pulley 7 and actuated by said train of gearing 11.

What is claimed is:—

1. An amusement device for bathing pools, comprising standards adapted to be located in a pool, pulleys having peripheral grooves journaled on said standards, a flexible member trained in the grooves of said pulleys, the flange under the groove in each pulley being relatively wide to prevent said member from dropping off the pulleys, means to actuate said flexible member from above, and lead lines secured to said flexible member and adapted for attachment to objects to be pulled through the pool.

2. An amusement device for bathing pools, comprising standards adapted to be located in a pool, pulleys having peripheral grooves journaled on said standards, an endless flexible member trained in the grooves of said pulleys, the flange under the groove in each pulley being relatively wide to prevent said member from dropping off the pulleys, a drive pulley located above and connected for simultaneous rotation with one of said pulleys, a motor geared to said drive pulley, and lead lines secured to said flexible member and adapted for attachment to objects to be pulled through the pool.

3. In an amusement device for bathing
pools having standards adapted to be located
in a pool, said standards having reduced cir-
cular bearing members for pulleys, one of
5 said bearing members being elongated, a
sleeve journaled in said elongated bearing
member, two pulleys secured to said sleeve
one above the other, the lowermost of said
pulleys alined with the pulleys on the other
10 bearing members, an endless flexible member
trained on said pulleys, and the upper pul-
ley on the sleeve geared to a power source.

In testimony whereof I affix my signature.

JULIUS J. STEINHART.
